EKRAN

“Using thin-film technology, European researchers have developed a new tactile display for blind computer users that they say will cost a fraction of the price of traditional Braille displays. When the film receives a signal from the computer, it can curve upward or downward, forcing a plastic pin into the display area of the module. The device has yet to be commercialized, but has already created a buzz, winning a €60,000 prize from the ONCE foundation in Madrid.

Nasil calisiyor?

Uzerindeki metal bolmeden parayi iceri aliyor ve ortasindaki silindirler yardimiyla hizada kalmasini sagliyor. Parayi belirli bir sirada aldigi icin istenilen miktari vermek icin milimetrik farkliliklarla dizilen parayi yine para cikis kismindaki ufak silindirler ile veriyor.
